# Table and Phone Prototypes

with annotations

1. My logo has fixed width as I don't want it to stretch too much across the screen.

2. For tablets and phones, the navigation bar appears when the hamburger button is clicked (functional on the website). Here, the navigation items are listed vertically, rather than horizontally.
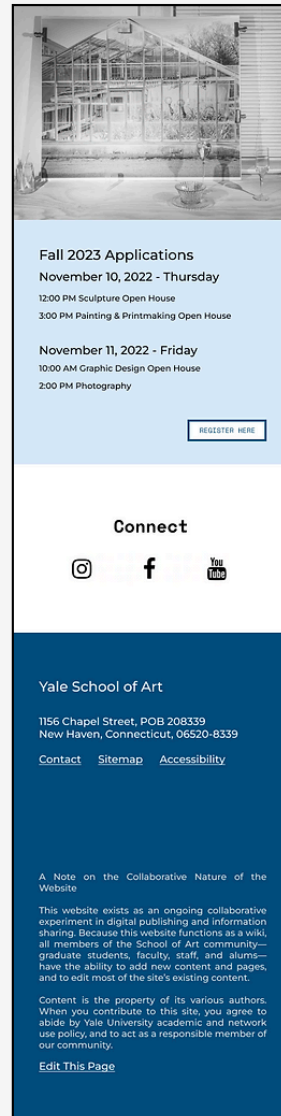

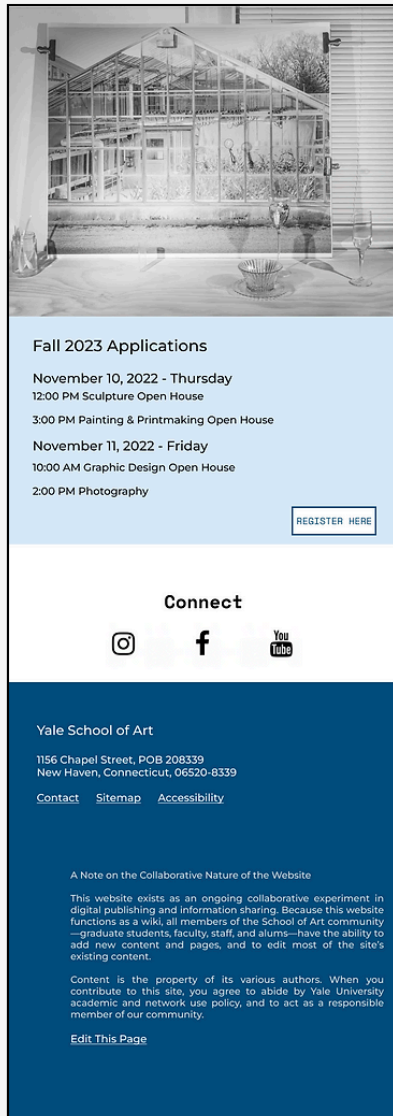

3. The subtitle under "Apply to School" title is removed when the screen size is too narrow--it is not there by default for phones.

4. There aren't many design changes from the desktop view. The only change is that now the blue box stretches across the screen

1. Because touch-screen devices don't have hovering function, I simply display the "hover" version of the grid. The student art is displayed by default, the text is black, highlighted with a white streak.

2. On tablets, the display is two-boxes by row. On phones, it is one singular column.

1. The box is formatted the same as the application box above. There aren't many major changes when compared to the desktop display.

2. The blue box is formatted the same way as the application box above. There is a consistent styling of buttons and the flow of information.

3. There aren't any changes for the footer, when compared to the desktop view. The text blocks for the tablet view are placed diagonally to account for the narrower screen size. The text blocks are displayed as a column under phone view for the same reason above.
